Practitioner: Kyla Johnson

Patient: Sun Valley's blue collar
Species/Breed: Dog / Labradoodle
Age/Gender: 4 Month(s) / male
Submitted Date: 10/04/2019 08:21:07 PM
Completed Date: 10/09/2019 12:30:44 PM

Case Status/Priority: Completed / Regular

Case History:

evaluation hips/elbows
Note: aka Nikki's Pup Blue Collar Boy

Case Report:

468199 KW/bs

Three digitalized radiographic images containing projections of the pelvis and elbows were submitted for evaluation. The radiographs are dated 9/20/19.

Radiographic Findings:

Both femoral heads are well seated in their respective acetabula and are congruous with the acetabular rims. Greater than 50% of the femoral heads are located medial to the dorsal acetabular rims. No osteophyte formation is present on the femoral necks or acetabula. Alignment of the patellae with the femurs is normal. Muscle volume in both hind legs is within normal limits. The anconeal process of both ulnae and proximocranial aspect of both radii are smooth with no evidence of osteophyte formation. No sclerosis is associated with the ulnar notches. Both medial coronoid processes are smooth in contour and a fragment associated with the medial coronoid processes is not present.

Diagnosis: Normal pelvis and elbows.

Comments: Radiographic changes to suggest elbow or hip dysplasia are not present. Based on the OFA scheme of evaluating hips, the hips would be rated as good in conformation. Radiographs obtained at 2 years of age will need to be evaluated to completely exclude elbow and hip dysplasia and to establish a final rating on the coxofemoral joints.
